Two-sided bounds for $L_p$-norms of combinations of products of independent random variables

Ewa Damek (Wroclaw University)
(based on the joint work with
Rafal Latała, Piotr Nayar - University of Wasaw
and Tomasz Tkocz - University of Warwick)

I am going to show that for every positive $p$, the $L_p$-norm of linear combinations (with scalar or vector coefficients) of products of i.i.d nonnegative random variables with the $L_p$-norm one is comparable to the $l_p$ norm of the coefficients and the constants are explicite. More precisely, let $X, X_1, X_2, \ldots$ be i.i.d. nonnegative r.v.'s such that $\mathbb{E}X = 1$ and $\mathbb{P}(X = 1) < 1$. Define

$$R_0 := 1 \quad \text{and} \quad R_k := \prod_{j=1}^{k} X_j \quad \text{for } k = 1, 2, \ldots.$$ 

Then the following theorem holds

**Theorem 1.** Let $p > 0$ and $X, X_1, X_2, \ldots$ be an i.i.d. sequence of nonnegative r.v.'s such that $\mathbb{E}X^p < \infty$ and $\mathbb{P}(X = t) < 1$ for all $t$. Then there are constants $0 < c_{p,X} \leq C_{p,X} < \infty$ which depend only on $p$ and the distribution of $X$ such that for any vectors $v_0, v_1, \ldots, v_n$ in a normed space $(F, \| \|)$,

$$c_{p,X} \sum_{i=0}^{n} \|v_i\|^p \mathbb{E}R_i^p \leq \mathbb{E} \left\| \sum_{i=0}^{n} v_i R_i \right\|^p \leq C_{p,X} \sum_{i=0}^{n} \|v_i\|^p \mathbb{E}R_i^p.$$

As a result the same holds for linear combinations of Riesz products and similar bounds can be proved for partial sums of perpetuities $\sum_{i=1}^{n} R_{i-1} B_i$, where $(X_i, B_i)$ is an i.i.d sequence of random variables with values in $[0, \infty) \times \mathbb{R}$.
